Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope 91ycoprotein E1 (GP32) (GP35); Envelope 91ycoprotein E2
(GP68) (GPV0) (NS1); Protease/helicase N3 (P70) (Hepacivirin)
(EC 3.4.22.-); Protease/helicase N3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NSA (P56); Nonstructural protein
NSAB (P27); Nonstructural protein NSA (P56); Nonstructural protein
NSAB (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-76) (HCV).
                                                                                                                                                                                                                                                                                                                                                          MEDLINE-92044440; PubMed-1658196; Okamoto H., Okada S.-I., Sugiyama Y., Kurai K., Lizuka H., Wachida A., Miyakawa Y., Mayumi M.; Wachida A., Miyakawa Y., Mayumi M.; Nucleotide sequence of the genomic RNA of hepatitis C virus isolated irom a human carrier: comparison with reported isolates for conserved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and divergent regions.";
J. Gen. Virol. 72:2697-2704(1991).
I. Gen. Virol. 73:2697-2704(1991).
I. FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
I. CATALYTIC ACTIVITY: Hydrollysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
I. CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           [RNA](N)
-1- SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSIGNS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -1- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              IPRO02166, HCYERP

Virology 188:331-341(1992).
-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRARR-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in p1 and Ser or Ala in P1'.
-!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
SEQUENCE FROM N.A.

Hepatitis C virus.
Viruses: ssrNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Submitted (MAY-2001) to the EMBL/GenBank/DDBJ databases.
-!- SUBMITT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN B. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

Patent No. US/0020151484A1

GENERAL INFORMATION:

APPLICAMY: HYBRIGENICS

TITLE OF INVENTION: SID nucleic acids and polypeptides selected from TITLE OF INVENTION: applications thereof

FILE REFERENCE: B4809A - JAZ

CURRENT APPLICATION UNMER: US/09/921,397

PRIOR APPLICATION NUMBER: EP 00402225.7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 97;

TITLE OF INVENTION: New sequences of hepatitis C virus
TITLE OF INVENTION: genotypes for diagnosis, prophylaxis and therapy.
NUMBER OF SEQUENCES: 270
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25 (EPO)
                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

artificial gene and the resulting mosaic protein improve the sensiting spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAX106673-683 represent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 1994-298800/37.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    õ
                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                 The invention relates to a mosaic protein, comprising a plurality of antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted are useful for detecting a hepatitis infection in an individual. The mosaic protein is also useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a mosaic protein, comprising a plurality of monologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAQ70543 is a fragment of hepatits C virus (HCV) or non-B hepatits virus (NAMBH) core and envelope one structural regions, encompassing base pairs 349-1285. It codes for AARS8593 an antigen to a structural region of the HCV virus, which can be used in the diagnosis of NANBH patients and the detection of HCV carriers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosalc protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosalc protein and the artificial mosalc protein are useful for detecting a hepatitis infection in an individual. The mosalc gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, and antigen specificity of enzyme immunosacitylity, and antigen specificity of enzyme immunosassays. This provides improved detection of hepatitis C virus. Sequences AXY06633-683 represent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymerase chain reaction; PCR; amplify; primer; non-A, non-B hepatitis; NANBH; virus; blood transmissible; detection; hepatitis virus; RT-PCR; C100 antibody; HCV RNA; NS5 region.

                                                                                                                                                                                   This sequence is encoded by the genome of a blood transmissible non-A, non-B hepatitis (NANBH) virus. The cDNA sequence was isolated using the primers given in AAQ63500-35. The amplified fragments are used in the detection of hepatitis virus. The target DNA was isolated from serum of chronically infected NANBH patients who were C100 antibody-positive and HCV RNA (NS5 region) positive. Reverse transcription-PCR and PCR were performed on cDNA and the total human NANBH DNA was constructed from 23 clones.

The invention relates to nucleic acid construct which comprises an expression cassette including a first polynucleotide region including a 5' non-coding region (NCR) sequence of an RNA virus and at least an N-terminal portion of a coding sequence of RNA virus, a second polynucleotide region including a 3' untranslated region (UTR) sequence of the RNA virus and at least a C-terminal portion of a coding sequence of the virus and a third polynucleotide region encoding a reporter promoter, flanked by first and second polynucleotide a regions; and a manner so as to enable a transcription of a minus strand RNA molecule from the expression cassette. Nucleic acid construct of the invention is useful for detecting the presence of an RNA virus in a cell. It is also useful for screening anti-viral drugg and determining drug
Novel nucleic acid construct useful for detecting the presence of RNA virus, comprises an expression cassette and a promoter operably linked to expression cassette for minus strand RNA transcription of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is encoded by the oligonucleotide, CN14, and represents the peptide fragment CP14. CP14 is a fragment of the core region of hepatitis C virus (HCV). CP14 may be used in the detection of HCV infection and to raise antibodies against it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            resistance of an RNA virus. The present sequence is Hepatitis \hat{C} virus (HCV) isolate HCV-S1 full-length polyprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific antibodies.
                                                                                                                                                                      Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-B, non-B hepatitis; competitive; inhibition assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-B hepatitis; competitive; inhibition assay.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific

The present sequence represents a Hepatitis C virus (HCV) protein sequence from the disclosure of the present specification. The present specification describes a chimeric HCV peptide antigen which comprises at least 2 peptide epitope regions from the HCV polypeptide core region, 2 peptide epitope regions from the NS3 region and at least 2 peptide epitope regions from the NS3 region. The antigen binds specifically with an antibody produced by a human infected by HCV. The peptide can detect a wide range of HCV infections with high sensitivity.
                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                         The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capaid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a peptide, which is recognised by antibodies against amino acids 2-45 at the N-terminus of the core (or nucleocapsid) possibly to the period of hepatitis C virus (HCV), or its variants. The peptide has a tertiary structure consisting of two alpha-helical fragments, almost compendicular to each other in space, connected by a junction peptide. Excluded are all proteins and peptides comprising, or consisting of, the N-terminal part of p21 (starting from amino acid to x 2). Also new are cc (1) monoclonal or polyclonal antibodies produced using the peptide as an immunogen and (2) complex consisting of the peptide specifically cound to some other molecule, particularly peptide or nucleotide (1) can functionalised aromatic compounds. The peptide is used (1) cas immunogen for generating antibodies and (11) for detecting and complex formation). Antibodies are used correspondingly to detect HCV or related antigens. The peptide and antibodies may also be used to treat or prevent HCV infections. The present sequence represents the N-terminus contracts of the core p21 protein of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nseq

diagnosing and preventing hepatitis C infections -

Claim 1; Page 42; 50pp; English.

The present peptide, designated S42G, corresponds to residues 2 to 45 of the N-terminus of the human hepatitis C virus (HCV) core protein. It is an immunodominant region containing conformational type epitopes and linear type epitopes. It manifests an immunoreactivity with all the sera of individuals or blood samples infected with HCV and which possess substituted for homologous amino acros protein. An amino acid may be substituted for homologous amino acids and side chains and peptide bonds may be modified. For example, L-amino acids may be replaced by D-amino sequence and its antiqenic derivatives may be used for detection of hepatitis C virus and for raising antibodies against the virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A41370

Genome polyprotein - hepatitis C virus (genotype 5, N4) (fragment)
Noontains: core protein
Noontains: core protein
C;Species: hepatitis C virus
A;Variety: genotype 5, N4
C;Date: 19-May-1994 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C;Accession: 541370
R;van Doorn, L.J.; Kleter, G.E.M.; Brouwer, J.T.
submitted to the EMBL Data Library, January 1994
A;Reference number: 541341
A;Accession: 541370
A;Accession: 541370

S41369
genome polyprotein - hepatitis C virus (genotype 5, N3) (fragment)
N:Contains: core protein
C:Species: hepatitis C virus
A:Variety: genotype 5, N3
C:Species: hepatitis C virus
A:Variety: genotype 5, N3
C:Date: 19-May-1994 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C;Accession: S41369
R;Van Doorn, L.J.; Kleter, G.E.M.; Brouwer, J.T.
submitted to the EMBL Data Library, January 1994
A;Description: Analysis of hepatitis C virus genotypes 1 to 5 by LiPA.
A;Reference number: S41349
A;Rolecule type: genomic RNA
A;Resious: 1-114 <VANN
A;Resious: 1-114 <VANN
A;Resious: genomic RNA
A;Resperimental source: genotype 5, N3
C;Superfamily: hepatitis C virus genome polyprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Virology 188:331-341(1992).
-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPMOREIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CELLULAR AMINOPEPTIDASE.
